

Java Static_INITIALIZER Block

Static initialization blocks are executed when the class is loaded, and you can initialize static variables in those blocks.

It's time to test your knowledge of *Static initialization blocks*. You can read about it [here](#).

You are given a class *Solution* with a *main* method. Complete the given code so that it outputs the area of a parallelogram with breadth *B* and height *H*. You should read the variables from the standard input.

If $B \leq 0$ or $H \leq 0$, the output should be *"java.lang.Exception: Breadth and height must be positive"* without quotes.

Input Format

There are two lines of input. The first line contains *B*: the breadth of the parallelogram. The next line contains *H*: the height of the parallelogram.

Constraints

$$-100 \leq B \leq 100$$

$$-100 \leq H \leq 100$$

Output Format

If both values are greater than zero, then the *main* method must output the area of the *parallelogram*. Otherwise, print *"java.lang.Exception: Breadth and height must be positive"* without quotes.

Sample input 1

```
1
3
```

Sample output 1

```
3
```

Sample input 2

```
-1
2
```

Sample output 2

```
java.lang.Exception: Breadth and height must be positive
```
