

Day 1: Cut #2

Objective

In this challenge, we practice using the *cut* command to get and print characters from a file.

Resources

[This](#) is a very well written tutorial demonstrating different ways in which *cut* may be used to either print characters at a particular position, or to print columns of a text file based on delimiters. The latter is particularly useful while dealing with tabulated data in *.tsv or *.csv format.

Task

Display the *2nd* and *7th* character from each line of text.

Input Format

A text file with *N* lines of [ASCII](#) text only.

Constraints

- $1 \leq N \leq 100$

Note: These values don't really impact your command.

Output Format

The output should contain *N* lines. Each line should contain just two characters at the *2nd* and the *7th* position of the corresponding input line.

Do **not** code defensively for situations where the text is short, and the required characters may not be present in a line of text. The *cut* command will handle it and will not display any character or line in such a situation.

Sample Input

```
Hello
World
how are you
```

Sample Output

```
e
o
oe
```
