

# Java Iterator

Java Iterator class can help you to iterate through every elements in an collection. Here is a simple example:

```
import java.util.*;
public class Example
{

    public static void main(String []argh)
    {
        ArrayList mylist = new ArrayList();
        mylist.add("Hello");
        mylist.add("Java");
        mylist.add("4");
        Iterator it=mylist.iterator();
        while(it.hasNext())
        {
            Object element = it.next();
            System.out.println((String)element);
        }
    }
}
```

In this problem you need to complete a method *func*. The method takes an *ArrayList* as input. In that *ArrayList* there is one or more integer numbers, then there is a special string "####", after that there are one or more other strings. A sample *ArrayList* may look like this:

```
element[0]=>42
element[1]=>10
element[2]=>"# # #"
element[3]=>"Hello"
element[4]=>"Java"
```

You have to modify the *func* method by editing at most **2** lines so that the code only prints the elements after the special string "####". For the sample above the output will be:

```
Hello
Java
```

*Note:* The stdin doesn't contain the string "####", it is added in the *main* method.

To restore the original code in the editor, click the top left icon on the editor and create a new buffer.
