

Display an element of an array

Given a list of countries, each on a new line, your task is to read them into an array and then display the element indexed at **3**. Note that indexing starts from **0**.

Recommended References

Here's a [great tutorial](#) tutorial with useful examples related to arrays in Bash.

Input Format

A list of country names. The only characters present in the country names will be upper or lower case characters and hyphens.

Output Format

The element at index **3** of the array (one string).

Sample Input

```
Namibia
Nauru
Nepal
Netherlands
NewZealand
Nicaragua
Niger
Nigeria
NorthKorea
Norway
```

Sample Output

```
Netherlands
```

Explanation

The element at index **3** in the list is *Netherlands*.
