Merging Communities

People connect with each other in a social network. A connection between Person I and Person J is represented as M I J. When two persons belonging to different communities connect, the net effect is the merger of both communities which I and J belongs to.

At the beginning, there are N people representing N communities. Suppose person 1 and 2 connected and later 2 and 3 connected, then 1,2, and 3 will belong to the same community.

There are two type of queries:

- 1. $\mathbf{M} \mathbf{I} \mathbf{J} \implies$ communities containing person I and J merged (if they belong to different communities).
- 2. $\mathbf{QI} \implies \text{print the size of the community to which person } I \text{ belongs.}$

Input Format

The first line of input will contain integers N and Q, i.e. the number of people and the number of queries. The next Q lines will contain the queries.

Constraints:

 $1 \le N \le 10^5$ $1 \le Q \le 2 \times 10^5$

Output Format

The output of the queries.

Sample Input

```
3 6
Q 1
M 1 2
Q 2
M 2 3
Q 3
Q 2
```

Sample Output

```
1
2
3
3
```

Explanation

Initial size of each of the community is 1.
