Positive Lookahead

regex_1(?=regex_2)

The positive lookahead (?=) asserts regex_1 to be immediately followed by regex_2. The lookahead is excluded from the match. It does not return matches of regex_2. The lookahead only asserts whether a match is possible or not.

In the above image, the Regex Pattern is matched with the Test String.

Task

You have a test string S.

Write a regex that can match all occurrences of \circ followed immediately by $\circ \circ$ in S.

Note

This is a regex only challenge. You are not required to write code.

You have to fill the regex pattern in the blank (______).
