Mean, Var, and Std

mean

The *mean* tool computes the arithmetic mean along the specified axis.

```
import numpy

my_array = numpy.array([ [1, 2], [3, 4] ])

print numpy.mean(my_array, axis = 0)  #Output : [ 2. 3.]

print numpy.mean(my_array, axis = 1)  #Output : [ 1.5 3.5]

print numpy.mean(my_array, axis = None)  #Output : 2.5

print numpy.mean(my_array)  #Output : 2.5
```

By default, the axis is None. Therefore, it computes the mean of the flattened array.

var

The var tool computes the arithmetic variance along the specified axis.

```
import numpy

my_array = numpy.array([ [1, 2], [3, 4] ])

print numpy.var(my_array, axis = 0)  #Output : [ 1. 1.]

print numpy.var(my_array, axis = 1)  #Output : [ 0.25  0.25]

print numpy.var(my_array, axis = None)  #Output : 1.25

print numpy.var(my_array)  #Output : 1.25
```

By default, the axis is None. Therefore, it computes the variance of the flattened array.

std

The *std* tool computes the arithmetic standard deviation along the specified axis.

```
import numpy

my_array = numpy.array([ [1, 2], [3, 4] ])

print numpy.std(my_array, axis = 0)  #Output : [ 1. 1.]

print numpy.std(my_array, axis = 1)  #Output : [ 0.5 0.5]

print numpy.std(my_array, axis = None)  #Output : 1.11803398875

print numpy.std(my_array)  #Output : 1.11803398875
```

By default, the axis is None. Therefore, it computes the standard deviation of the flattened array.

Task

You are given a 2-D array of size $N \times M$.

Your task is to find:

- 1. The mean along axis 1
- 2. The var along axis 0
- 3. The std along axis None

Input Format

The first line contains the space separated values of N and M. The next N lines contains M space separated integers.

Output Format

First, print the *mean*.
Second, print the *var*.
Third, print the *std*.

Sample Input

Sample Output

```
[1.5 3.5]
[1. 1.]
1.11803398875
```
