# **Java Arraylist**

Sometimes it's better to use dynamic size arrays. Java's Arraylist can provide you this feature. Try to solve this problem using Arraylist.

You are given n lines. In each line there are zero or more integers. You need to answer a few queries where you need to tell the number located in  $y^{th}$  position of  $x^{th}$  line.

Take your input from System.in.

## **Input Format**

The first line has an integer n. In each of the next n lines there will be an integer d denoting number of integers on that line and then there will be d space-separated integers. In the next line there will be an integer q denoting number of queries. Each query will consist of two integers q and q.

#### **Constraints**

```
1 <= n <= 20000
0 <= d <= 50000
1 <= q <= 1000
1 <= x <= n
```

Each number will fit in signed integer.

Total number of integers in n lines will not cross 100000.

### **Output Format**

In each line, output the number located in  $y^{th}$  position of  $x^{th}$  line. If there is no such position, just print "ERROR!"

#### **Sample Input**

```
5
5 41 77 74 22 44
1 12
4 37 34 36 52
0
3 20 22 33
5
1 3
3 4
3 1
4 3
5 5
```

#### **Sample Output**

```
74
52
37
ERROR!
ERROR!
```
